KANSAS CITY: 1954

TEXAS - JANUARY 1954

E. A. Farrell, Section Director - Houston

WEATHER SUMMARY

Temperatures averaged above normal over the State, and were considerably above normal in the Panhandle, the south-central, the extreme west, and the extreme southern divisions. Precipitation was above normal in some localities in north-central and northeast Texas, but averaged below normal elsewhere, and was considerably below normal in the south-central, the extreme south, and the upper coast divisions.

The first eight days averaged above normal in temperature with a sharp change to colder temperatures from the 9th to the 11th. Freezing temperatures extended southeastward to Austin and San Antonio. Frontal showers occurred as colder air moved down-state with the heaviest amounts in the eastern third of the State. The greatest precipitation in 24 hours was 3.00 inches at Bronson on the 9th and 10th. The extreme west and the extreme south had little or no rain during the first decade. Temperatures averaged above normal from the 12th to the 20th, when most stations recorded their highest temperature for the month. The highest temperature in the State was 90° at Laredo, McAllen, and McCook, on the 20th. A second mass of cold air entered the State on the 20th, bringing snow, sleet, and freezing rain in northern sections. Most stations recorded their lowest temperature for the month on the 22nd. The lowest temperature in the State was 4° below zero at Littlefield on the 21st. Sub-freezing temperatures did not extend into the Lower Rio Grande Valley, although the Wintergarden area around Eagle Pass had temperatures as low as 25°. After the 22nd, light rains occurred mostly in northern and eastern areas with very little rain in the northwest, the extreme west, and the extreme south. Temperatures after the 22nd were near seasonal normal with freezing confined to northern portions. The greatest monthly precipitation was 5.78 inches at Naples 5 NE. Minor flooding occurred in northeast Texas along the Sulphur and Sabine Rivers from the 17th to the 28th from rains that fell from the 10th to the 16th.

Farm activity was stepped up during the open warmer weather of the month, but was stopped by the northers that moved into the State on the 9th and 20th. In the Plains country, light snow and rain coming with the fronts were temporarily helpful, but more moisture was needed. Over the eastern third of the State, soils were still wet. Progress of commercial vegetables in south Texas continued favorable. The cold wave that reached into the extreme southern counties caused no damage to hardy type crops. Throughout west Texas condition of livestock remained only fair to good; very little grazing was available and heavy supplemental feeding continued. Marketing of calves and yearlings from small grain pastures continued active.

No severe storms were reported in the State during the month.--CBC

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

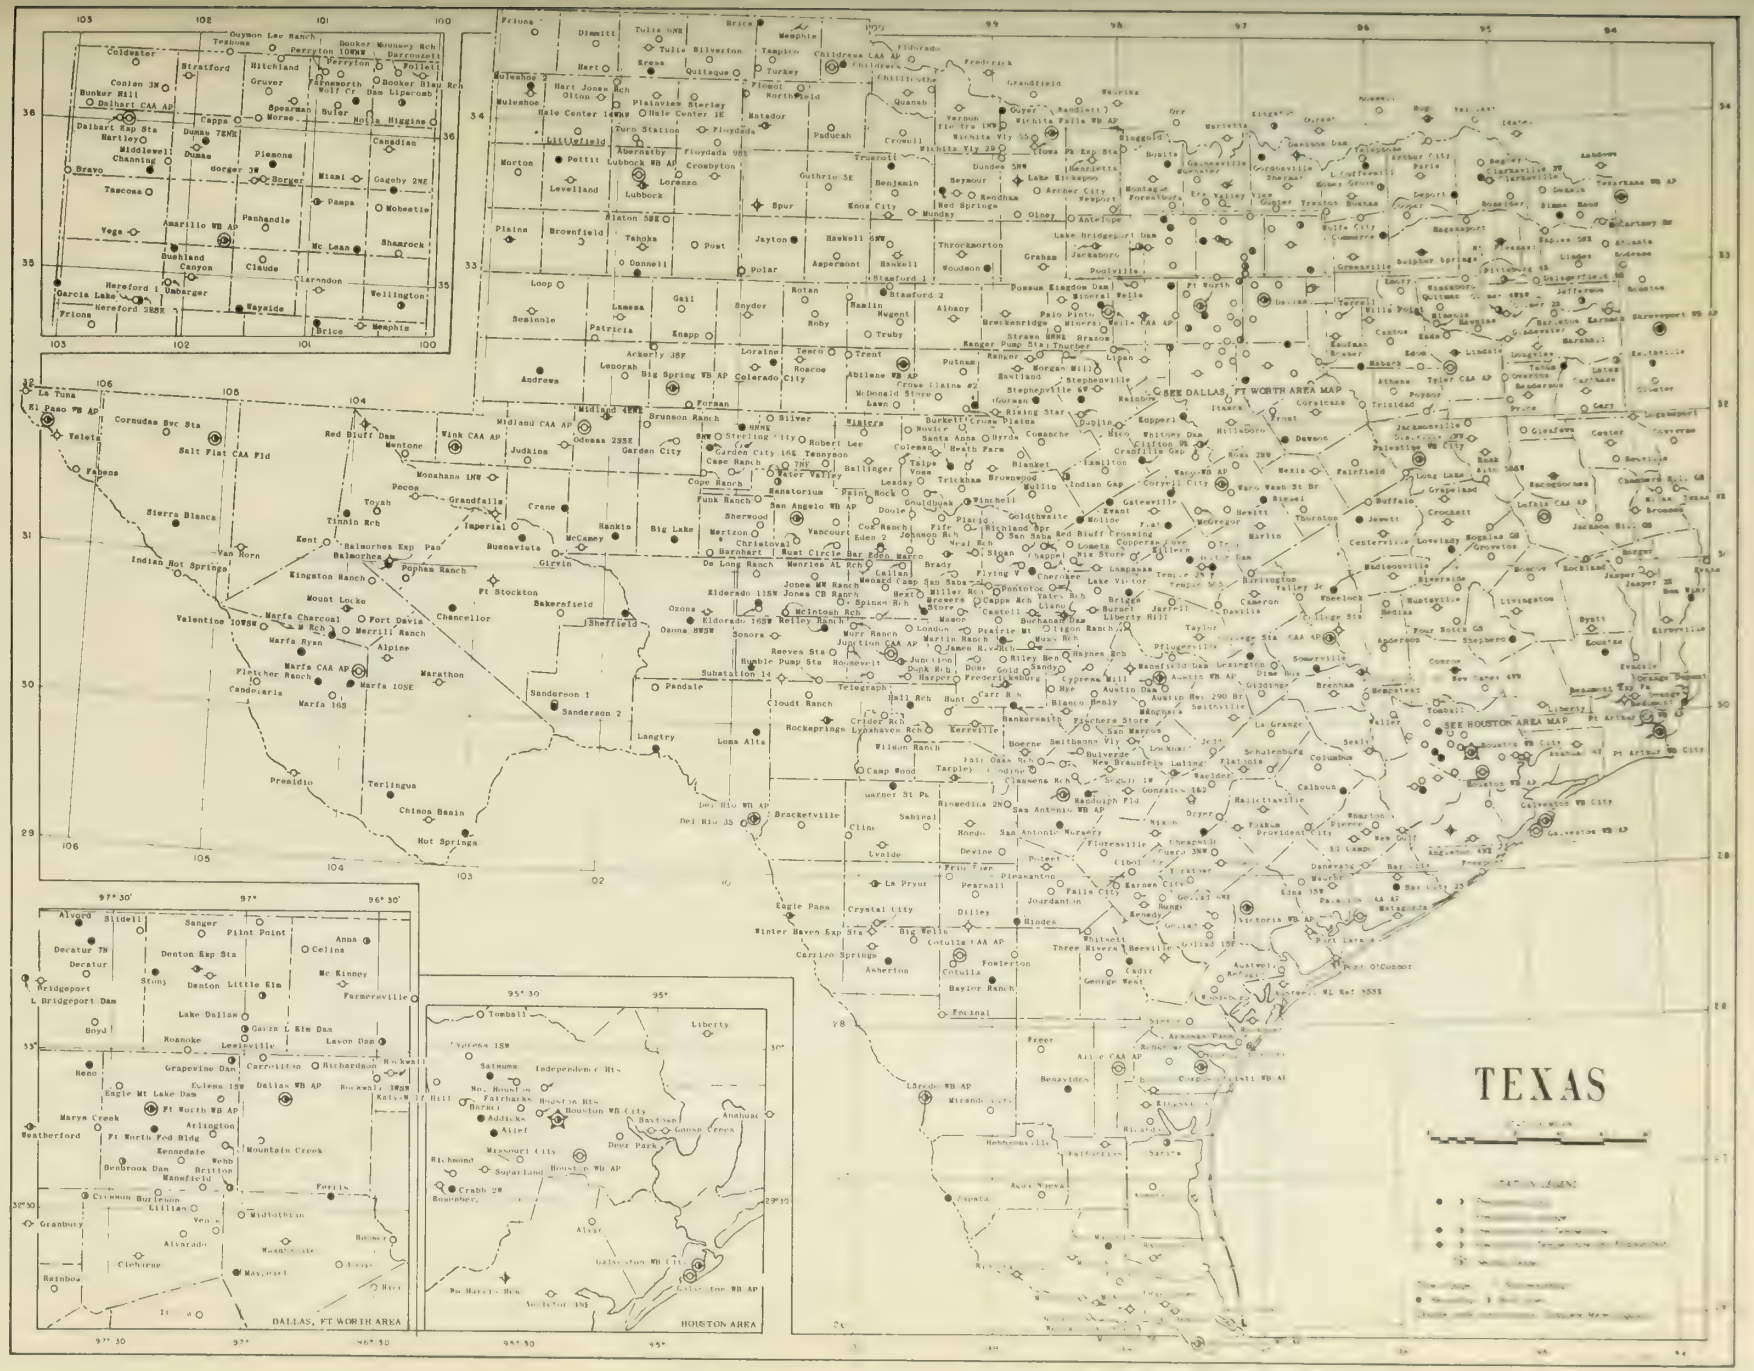
Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.



Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

Φ	Data in the column formerly headed "No. of Days .01 or more" have been changed to "No. of Days .10 or more" effective January 1, 1954.
-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

TEXAS

MAY 8 1954

FEBRUARY 1954

Volume LIX No. 2

KANSAS CITY: 1954

TEXAS - FEBRUARY 1954

E. A. Farrell, Section Director - Houston

WEATHER SUMMARY

February 1954 was warm windy, dusty, and dry in Texas. Temperatures averaged 3-5° above normal over most of the State and 6-9° above in the north-central and northeastern portions. Precipitation was below normal over the entire State except above in the western Panhandle. In general, precipitation was 5-20% of normal. Dry soil conditions favored dust storms on the 19th and 27th which were reminiscent of the 1930's.

A few light showers fell on the 1st and 2nd, but most of the first week was fair and mild in all areas. Temperatures averaged somewhat above February levels until the 8th, when dry, cold air moved downstate, bringing the monthly low temperatures to most stations and a light freeze southward to Corpus Christi. A slow warm-up for a few days was followed by colder air moving in on the 12th. The lowest temperature for the month was 14° at Canyon on the 12th, at Littlefield on the 13th, and at Mount Locke on the 28th. Temperatures were near the seasonal normal during the second week with only a few scattered light showers. One of the worst dust storms began on the 19th and swept across the entire State including the coastal section. Showers preceded the dusty norther and were heavy enough in East Texas to be of some benefit. The greatest 24-hour precipitation was 2.67 inches at Boxelder on the 20th. Temperatures during the third week were unseasonably mild. The highest temperature in the State was 99° at Eagle Pass on the 26th. Most stations recorded their monthly highest temperature on the 26th or 27th. A serious dust storm moved into central and coastal areas on the 27th. The greatest monthly precipitation was 2.94 inches at Boxelder.

Cotton planting was becoming general in the Lower Valley with a few fields already up to a stand. As fields dried in the eastern districts, preparation of land for cotton, sorghums and corn was pushed along rapidly. Wheat in the northwest was holding up surprisingly well considering the scant moisture. Small grains in North Texas made good growth but in the southern part of the State oats for grazing made slow progress due to lack of rainfall. Conditions were favorable for commercial vegetables in most South Texas areas. Tender crops that were subjected to the low temperatures of the 8th suffered only minor damage. Remaining hardy type vegetables are in good condition and harvest of most crops was active. Erosion during the last ten days of February was severe even though most farmers chiseled fields to retard soil movement. Sand drifts were piled to fence tops in places and the entire Northwest was covered with "flour-fine" dust. Native range grass and small grain pastures over the entire State collected a coating of unpalatable dust which settled from the recurring sand storms. Heavy supplemental feeding of hay and concentrates continued in the West.

LOCAL STORMS

Two tornadoes occurred on the 19th: (1) at Gorman, Eastland County, where 13 buildings were destroyed, 18 homes and 20 other buildings damaged, with damage amounting to $7,500; and (2) at Conroe, Montgomery County, where 4 homes and 10 other buildings were destroyed, 9 homes and 4 other buildings damaged, with damage amounting to $200,000. The Gorman storm injured two persons, and the Conroe storm injured seven persons. Also on the 19th, near Sulphur Springs, Hopkins County, lightning struck a house and caused fire. Two barns were demolished by high wind. Damage amounted to $3,500 near Sulphur Springs in Rockdale community.--CBC

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

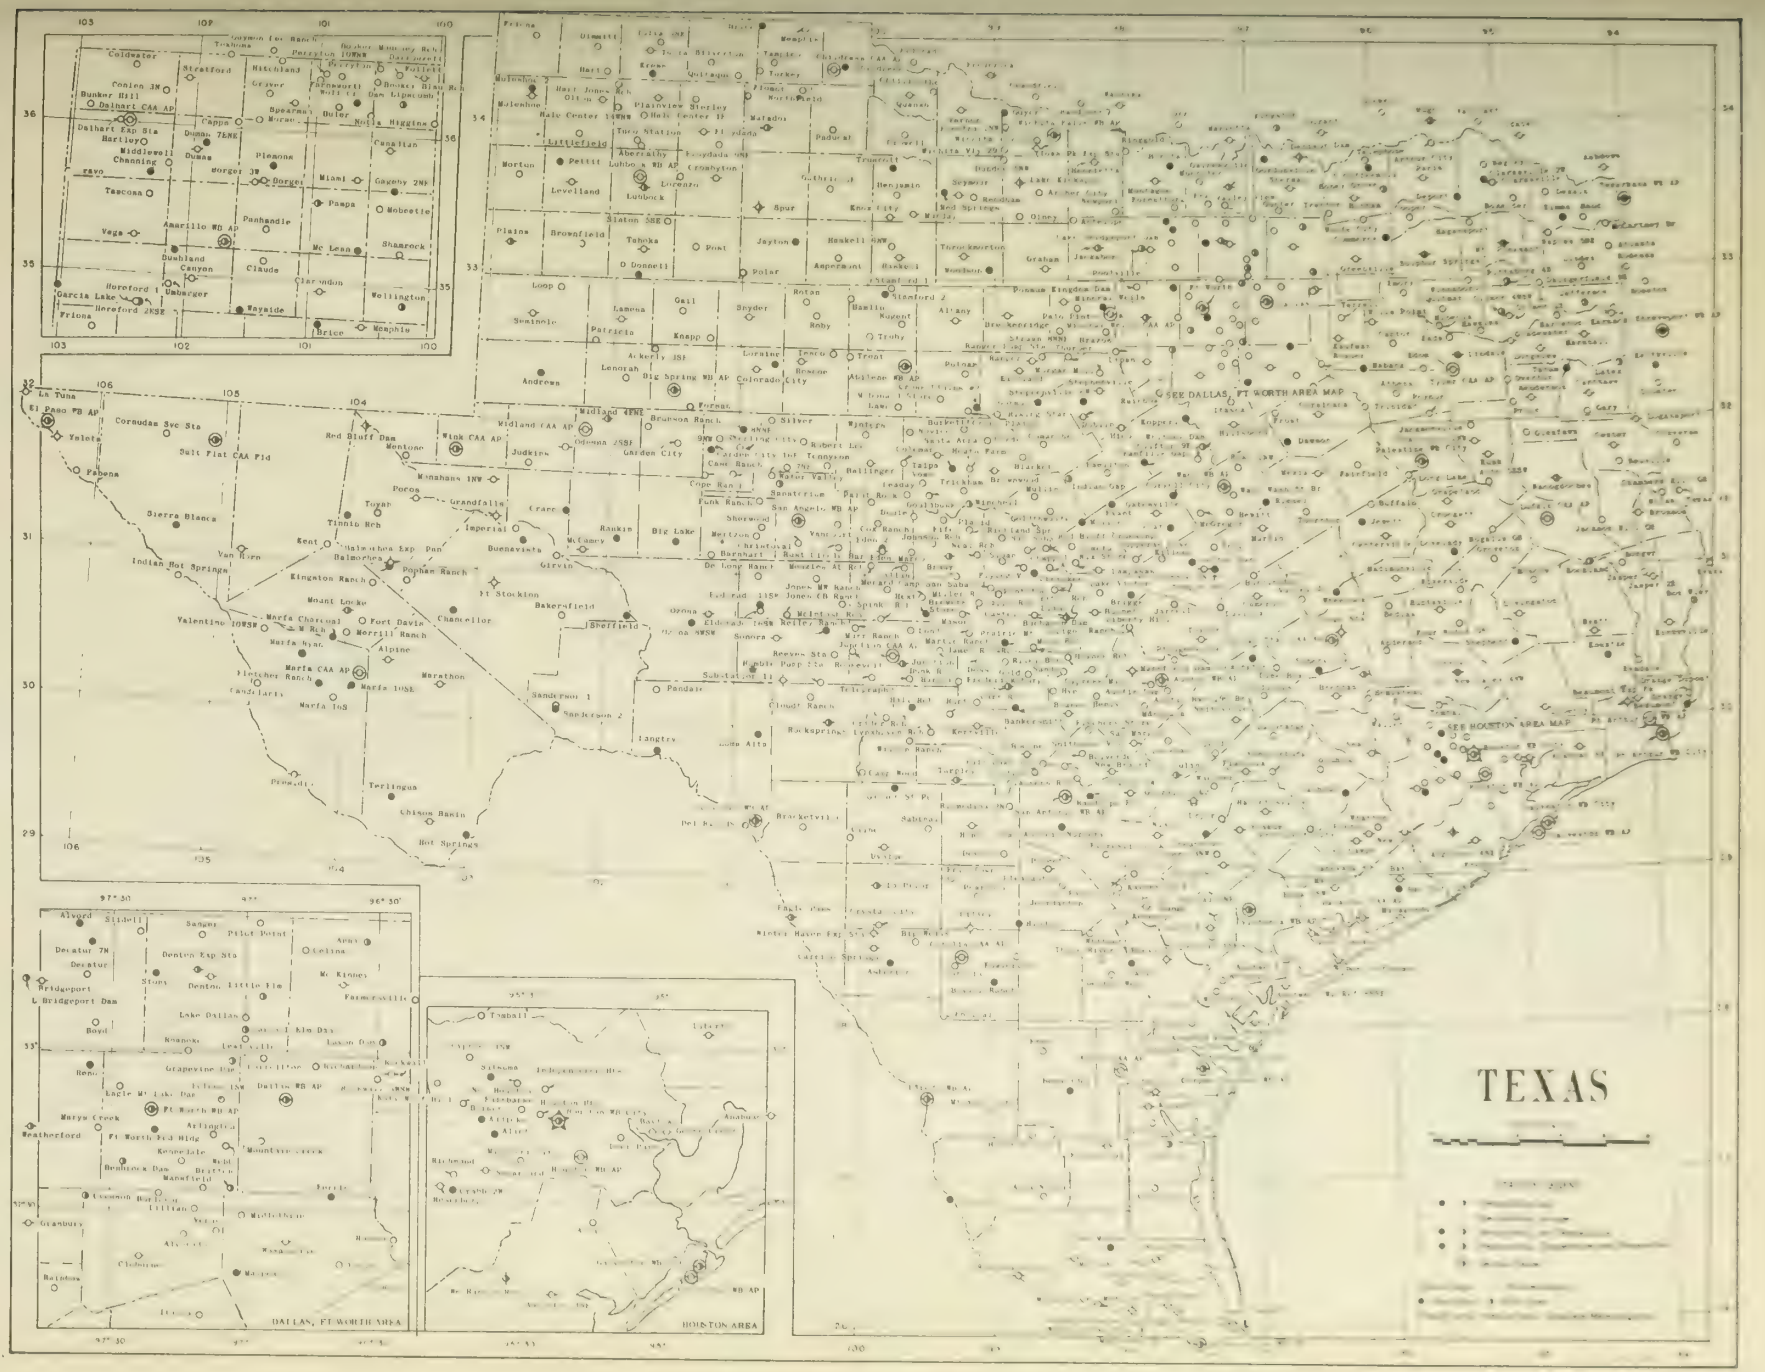
Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.



Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

Ⓓ	Data in the column formerly headed "No. of Days .01 or more" have been changed to "No. of Days .10 or more" effective January 1, 1954.
-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Daily values and monthly total from recording gage.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

TEXAS

MARCH 1954

Volume LIX No. 3

JUN 7 1954

KANSAS CITY: 1954

TEXAS - MARCH 1954

E. A. Farrell, Section Director - Houston

WEATHER SUMMARY

The month was windy, dusty, and dry over the State. Temperatures were near normal, averaging within 2° of the normal generally in all major divisions. Precipitation was below normal over the entire State. The month was the second driest March since Texas records began in 1888. Only March, 1899 was drier with a weighted average of 0.33 of an inch as compared to an average of 0.41 of an inch this month. Dry soil conditions on several days favored dust storms which were similar to those in the 1930's.

As cold air moved downstate during the first five days, moisture was condensed as scattered showers with snow occurring as far southeast as Austin and with sleet occurring at San Antonio. Showers were heavy in the north-central, the northeast, and upper coast divisions. Freezing temperatures extended as far southward as Del Rio and Austin. On the 3rd, Dalhart and Stratford recorded a low temperature of 4°, which was the lowest in the State for March. Warm tropical air brought a quick return to warm temperatures from the 9th to the 12th, with most stations recording the highest temperature for the month on the 10th or 11th. Cold air again invaded the State on the 13th, bringing the lowest temperature for the month to most stations on the 14th. Tulia recorded 4° on the 14th, which tied for the lowest in the State. This second cold air mass again brought sleet as far southward as San Antonio. Warm temperatures and scattered showers prevailed during the last half of the month. Showers were heavy in the northeast division on the 18th and 19th and in the north-central division on the 25th. Burleson had 2.36 inches on the 25th for the greatest precipitation in 24 hours. Showers were heavy in the upper coast division on the 27th and 28th. The highest temperature in the State was 108° at Rio Grande City on the 30th. The greatest monthly precipitation was 2.92 inches at Edom.

Small grain crops deteriorated further and field work was retarded as dry weather continued over most of the State. Exceptions were in the north-central and some northeast counties where general but light rains stimulated growth. In the northwest, high winds and dust continued to damage wheat and small grains. Corn planting continued in practically all areas under unfavorable moisture conditions for getting the crop to a stand. Irrigated cotton in the Lower Valley was in fairly good condition, despite some wind damage, but non-irrigated cotton and sorhums were severely damaged by high winds and blowing sand. Rice seeding gained momentum, under plans to irrigate rather than wait for rains. Commerical vegetables in the Lower Valley and other irrigated areas of South Texas made good progress. Harvest of onions, carrots, beets, and cabbage was active in the Lower Valley. Livestock remained in fair to good condition, although on supplemental feeding throughout the western two-thirds of the State where ranges were providing practically no feed and insufficient moisture was available to start new growth.

LOCAL STORMS

On the 24th, a series of thunderstorms, which accompanied a frontal passage in the north-central division damaged property from Brownwood to Honey Grove. Some hail damage was reported from Brownwood and Argyle, Denton County. At Fort Worth, there was some damage to moored light aircraft and hangar doors at Meacham Field. A tornado completely demolished one grain elevator at Frisco, Collin County The wind at McKinney was estimated at 100 miles per hour, and the steeple of the First Methodist Church was toppled while other buildings were unroofed. The major damage was in Collin and Fannin Counties with damage estimated at $12,000 at Frisco; $75,000 at McKinney; and $30,000 at Honey Grove.--CBC

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

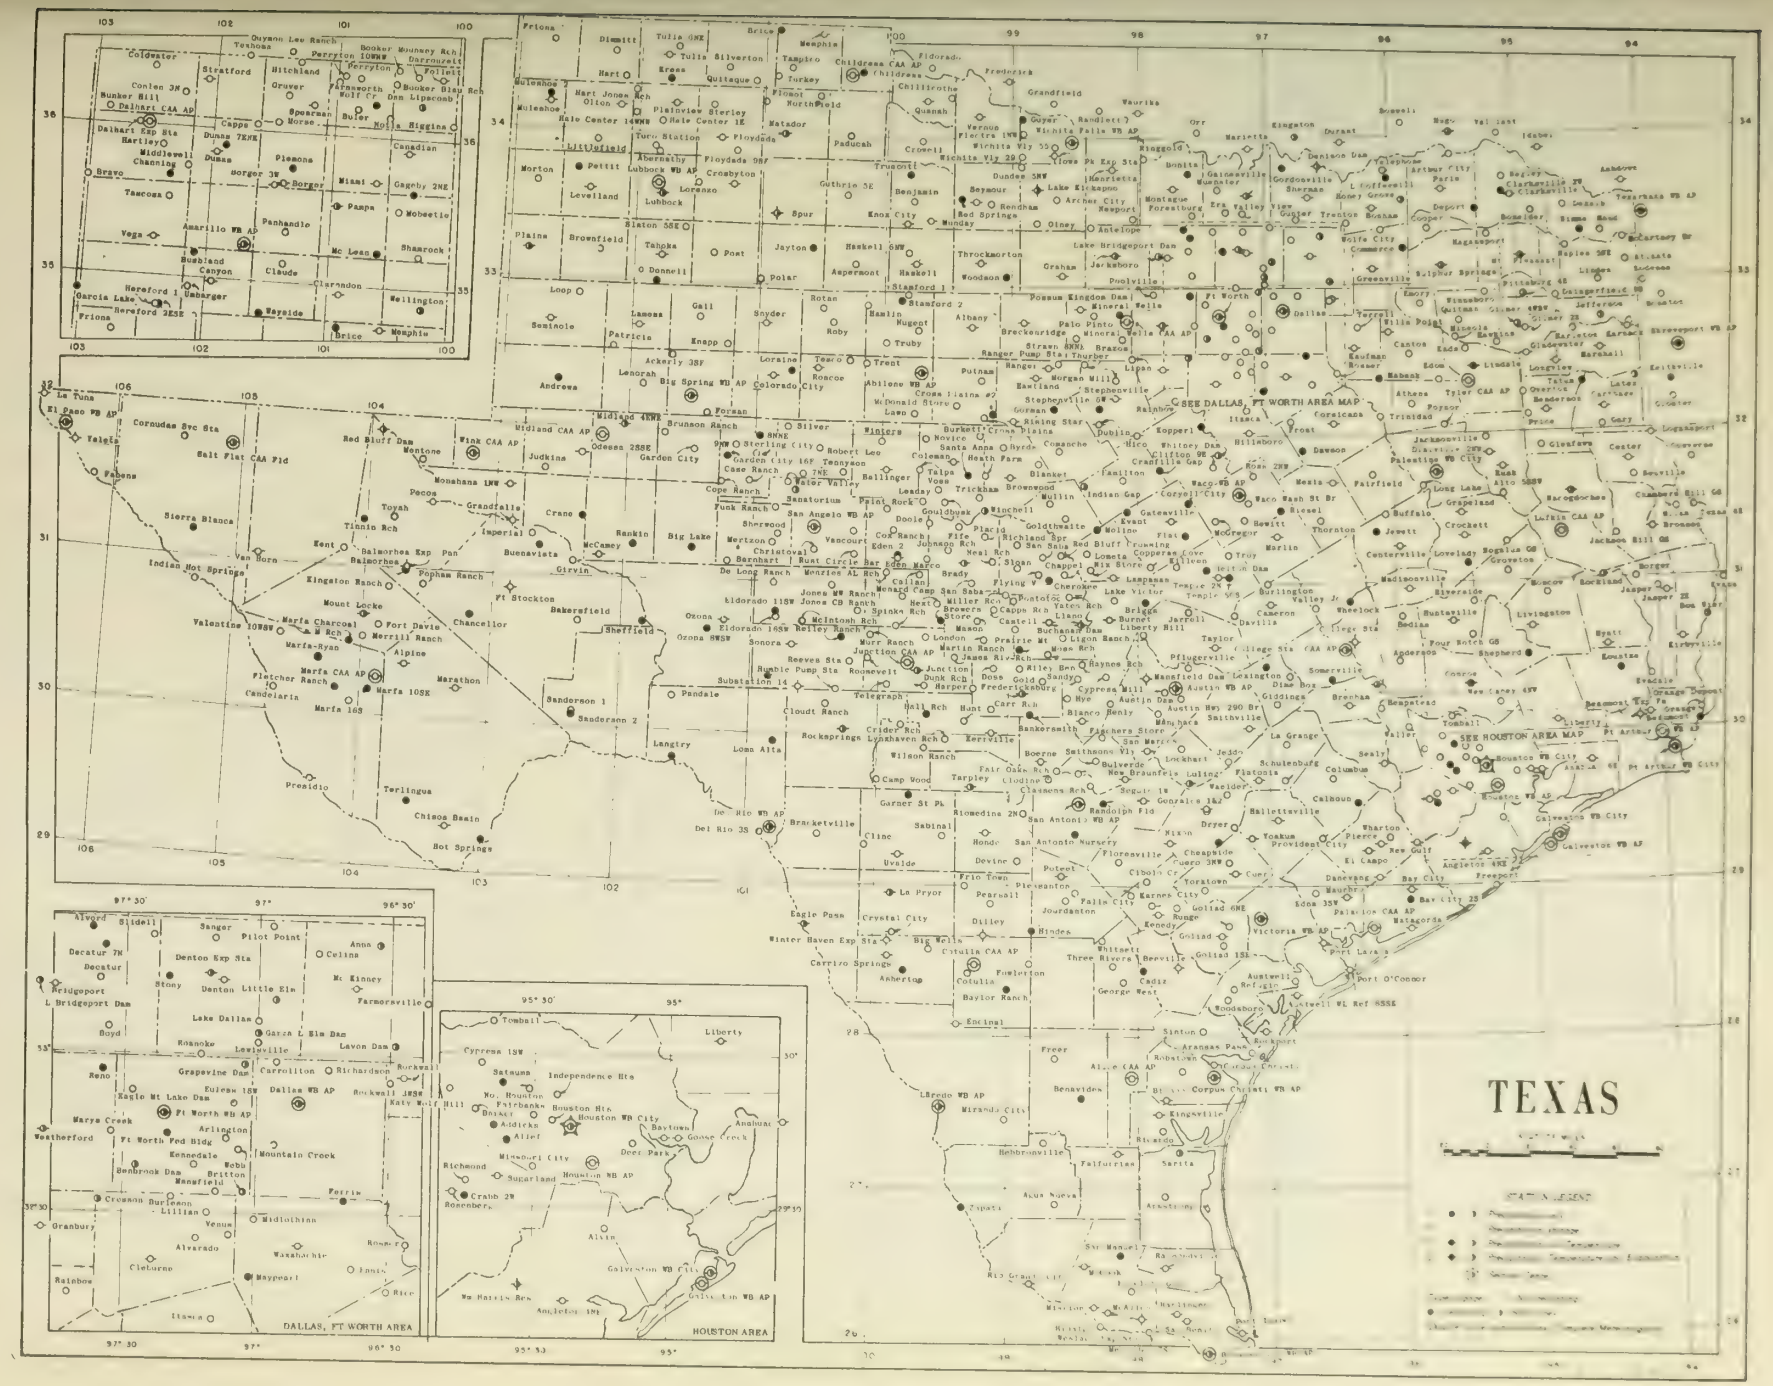
Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.



Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

©	Data in the column formerly headed "No. of Days .01 or more" have been changed to "No. of Days .10 or more" effective January 1, 1954.
-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

TEXAS - APRIL 1954

E. A. Farrell, Section Director - Houston

WEATHER SUMMARY

With an average temperature of 69.7°, this was the warmest April in Texas since 1948. The lowest average temperature was 58.2° at Stratford, and the highest average temperature was 78.6° at Rio Grande City. The greatest departure from normal temperature was +8.1° at Clarendon, while the average for the State was 4.5° above normal. Welcome rains gave above normal precipitation in heretofore dry areas in northwest, west-central, and extreme south Texas. Elsewhere over the State, rains were spotted. Although some stations in the eastern third reported below normal precipitation, amounts were generally ample for present needs. The greatest monthly precipitation was 10.58 inches at McAllen. Precipitation in the extreme southern division was the most since August 1953.

At the beginning of the month, temperatures were below normal over the State on the 1st, with the lowest temperature for the month of 20° occurring at Spur. Warm tropical air brought a quick return to above normal temperatures from the 2nd through the 7th. Only widely scattered showers occurred during the first week, but heavy rains were experienced in most sections from the 8th to the 16th. Invasions of cooler air brought relief to northern sections on the 7th and again on the 10th. The invasion of cool air which entered the Panhandle on the 15th extended to the Lower Rio Grande Valley on the 16th. Heavy rains occurred in the northern and western sections on the 22nd and 23rd. Then from the 27th to the end of the month, heavy rains occurred over most of the State, except in the extreme west. Extremely warm temperatures prevailed in the extreme west on the 18th and 19th. The highest temperature for the month was 106° at Boquillas Ranger Station on the 19th. As the month closed, another invasion of cool air entered the Panhandle.

Farmer's hopes for making a crop in 1954 were revived by the light to heavy rains which fell over much of the State. Only time will tell the extent of recovery the drought-stricken Low Rolling Plains and Cross Timbers wheat will make. Field work, which was much behind schedule, was gaining momentum as fields dried. Dry-land cotton and feed crop prospects in the Lower Valley were materially improved by soaking rains. Cotton planting will become active over the eastern third of the State as soon as soils dry. Commercial vegetable prospects were improved for the State as a whole despite some damage to advanced crops in areas of the Lower Valley where rains up to eleven inches were unofficially reported. Prospects for green range feed were greatly improved over much of the State.

LOCAL STORMS

On the 7th, a wind and hailstorm, which covered approximately 100 square miles left property damage amounting to $750,000 at Glenrose, Cresson, and Weatherford. On the 11th, wind and hail brought minor damage to Wink. On the 15th, minor damage was reported from tornadoes six miles southeast of Kirbyville, Newton County, and near Cypress and Fairbanks in Harris County. Also on the 15th, at San Ygnacio (near Laredo), wind and hail left heavy loss to crops estimated at $150,000 and property estimated at $10,000. The hail was reported as large as baseballs, and the wind was estimated at 100 mph. On the 21st, at Fort Stockton, a tornado ripped roofs from two homes and damaged several. Tornadoes were also reported from Midland, Post, and in northeast Borden County on the 21st, but no damage was observed. On the 25th, a hailstorm damaged property and crops from Tulia to Conway, leaving $45,000 worth of damage. Hail was baseball size near Tulia and the size of golf balls at Conway. Minor damage from wind and hail occurred in Haskell County on the 27th, and from a small tornado near Ballinger. On the 28th, a tornado was reported six miles east of Clifton with only minor damage. In Runnels County on the 29th, a tornado caused considerable damage, but no estimate was available on the amount of damage. Numerous tornadoes and windstorms were reported in the eastern half of the State on the 30th. The places and amount of damage are as follows: Fairy (Hamilton County), $16,000; Fort Worth, $750,000; San Antonio, $25,000; from Coupland (Williamson County) to Grapeland, $200,000; in Lee, Fayette, and Washington Counties, $12,000; Dallas, $400,000; Robertson and Falls Counties, several thousand dollars; from Groveton to San Augustine, $90,000; Tyler, $200,000; Tabor (Brazos County), $6,000; Lone Star (near Daingerfield) to Atlanta, $12,000; and DeKalb, $7,000. Both Atlanta and DeKalb storms moved into southwest Arkansas. --CBC

This issue contains additional precipitation data for the storm of April 9th on page 96.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

Ⓞ	Data in the column formerly headed "No. of Days .01 or more" have been changed to "No. of Days .10 or more" effective January 1, 1954.
-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

WEATHER SUMMARY

Temperatures averaged 1 to 6° below normal generally, except in the extreme western portion where they were slightly above normal. Minimum temperatures were generally cool, especially during the first part of the month when the lowest temperatures for so late in the spring were recorded at several stations in the eastern and northern two-thirds of the State. Although precipitation averaged 0.30 of an inch above normal for the State as a whole, there was considerable variation in departures from normal. Precipitation averaged above normal over the northwestern, the extreme western, the northeastern, and eastern portion of the upper coast divisions; but it was below normal in the central, the extreme southern, and the western portion of the upper coast divisions.

Showers were well distributed over the month with very few days on which measurable precipitation did not occur somewhere in the State. Heavy showers were generally confined to four periods: the 1st and 2nd; the 11th and 12th; the 18th and 19th; and the 23rd to the 27th. The greatest precipitation in 24 hours was 7.18 inches on the 25th at Port Arthur Airport. The greatest monthly precipitation was 13.91 inches at Bon Wier. Slight flooding occurred in the Sabine River basin during the month. May is generally the month of greatest flood frequency in Texas streams, so flooding was below normal this May. Most stations recorded their lowest temperature for the month on the 3rd or 4th. The lowest temperature for the State was 25° at Vega on the 3rd. The highest temperature for the State was 109° at Boquillas Ranger Station (Big Bend Park) on the 10th and also on the 30th. As might be expected, the highest temperatures occurred at most stations during the last few days, from the 28th to the 31st.

Growing crops and pastures received a big boost from soaking rains. Reserve moisture in the western half of the State, particularly the Low Rolling and southern High Plains, was the best in several years. Moisture was generally ample and the return of hot, open weather late in the month stimulated fast crop development. Wheat in important areas which survived earlier drought and the early May freeze now had ample moisture to mature some grain. Lower Valley cotton prospects remained very good. Picking started in the Valley with the first bale ginned on May 30th. Spring crop commercial vegetables were available in many areas extending from the Lower Valley into scattered east Texas sections. Range and pasture grass made remarkable growth over practically the entire State, except in the Lower Valley where grass was drying. Supplemental feeding had practically stopped.

LOCAL STORMS

On the 1st, a tornado moved from Crowell to Elliott, then crossed the Red River into Oklahoma, leaving property damage of $100,000 and crop damage of $1,250 and two persons were injured. Two homes and an oil mill were unroofed; three homes were demolished; lightning killed two head of cattle. Also on the 1st, a tornado destroyed one home and sent four persons to the hospital at Antelope. On the 2nd, wind caused minor damage at Pleasant Grove (Hopkins County) and at Gladewater. On the 11th, a funnel shaped cloud was reported by the Texas Highway Department at Cedar Park (Williamson County), but the funnel did not touch the ground. On the 18th, a tornado and hailstorm at Mosheim (Bosque County) twisted a windmill, unroofed houses, and damaged the oat crop, At Elgin on the 19th, wind damaged roofing amounting to $1,000. Hail damaged property amounting to $10,000 and crops amounting to $300,000 near Crosbyton on both the 22nd and the 23rd. Also on the 23rd, hail as large as golf balls damaged crops to the extent of $100,000 at Kress (Swisher County). On the 26th, hail as large as golf balls and wind damaged many roofs and autos and killed chickens and damaged some crops. At Andrews, a pilot reported a tornado touching the ground, but apparently caused no damage, on the 29th. Minor wind damage occurred at Greenville on the 31st.--CBC

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 8, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

©	Data in the column formerly headed "No. of Days .01 or more" have been changed to "No. of Days .10 or more" effective January 1, 1954.
--	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

JUNE 1954
Volume LIX No. 6

KANSAS CITY: 1954

TEXAS - JUNE 1954

E. A. Farrell, Section Director - Houston

WEATHER SUMMARY

Temperatures over Texas during June, 1954, were generally near to 2° above normal. A brief cool spell the first part of the month in the northern portion dropped the temperatures to near record values, equalling the all-time low for June at Dallas on the 4th. Precipitation was below normal over most of the State except along the Rio Grande Valley near and above Laredo into the Pecos Valley. The first hurricane of 1954, which moved inland to the south of Brownsville on the 25th, caused heavy rains from Laredo to Del Rio. When this storm reached the Pecos Valley, exceptionally heavy rains occurred, resulting in a disastrous flood on the Rio Grande from the Pecos River to Falcon Dam below Laredo. Heaviest amount during the 48-hour period was 27.1 inches near Pandale.

Showers were well distributed over the month with very few days on which measurable precipitation did not occur somewhere in the State. The lowest temperature for the month was 41° at Hereford on the 3rd. Most stations recorded their monthly minimum temperature on the 4th. The highest temperature for the month was 112° at Boquillas Ranger Station on the 6th and on the 9th. Most stations, however, recorded their monthly maximum temperature on the 30th, although the last half of the month was generally hot with little variation. As the first hurricane of this season moved inland up the Rio Grande Valley on the 25th, exceptionally heavy rains occurred in the Pecos Valley, which resulted in a record-breaking flood on the Rio Grande from the Pecos River to Falcon Dam. Supplemental precipitation data in this area are tabulated elsewhere in this bulletin. The greatest amount for the period June 26-28th was 27.1 inches near Pandale.

Combining wheat started in extreme north High Plains counties and gained momentum in central High Plains and northern Low Rolling Plains counties. Most grain was already out of the field in the southern Low Rolling Plains and northern Blacklands. North of a line about San Angelo, Brownwood, Waxahachie and Marshall, crops and pastures were making very satisfactory development as scattered showers provided additional moisture over most of that area. South of that line, however, feed crops and pastures deteriorated as soil moisture in that area was depleted by growing crops, strong winds and blazing sun. Movement of commerical vegetables from the early sections of South Texas was about over. In North Texas, bulk of the onion acreage was harvested and digging of potatoes was well along. Livestock generally were in good condition, and stock water was adequate throughout the State.

LOCAL STORMS

On the 1st, tornadoes and hailstorms occurred at Bakersfield, Pecos County and numerous communities near Paducah in Cottle County. Tornadoes occurred at Iowa Park and Wichita Falls, Wichita County and also near Silverton, Briscoe County. Hail was reported in Knox and Baylor Counties. Damage was most severe in Cottle County where crops were damaged to the extent of $6,611,500 and other property to the extent of $1,000,000. On the 2nd, a tornado occurred at Lake Creek, Delta County, with the loss of $10,000 in property with some crop damage; also a tornado which did not reach the ground occurred at Lorena, McLennan County. Wind damage was also reported in Rains and Falls Counties. Hail also damaged crops in Rains County. On the 4th, a windstorm occurred at Presidio with damage amounting to $7,000. On the 7th, at San Angelo and the North Concho Lake area, a wind and hailstorm left damage amounting to $1,500,000. Hail damage also occurred at Big Spring, Texas, on the 7th, damage amounting to $1,025,000. Minor wind and hail damage occurred in Nolan County on the 7th. On the 8th, hail was reported near Muleshoe and near Fort Stockton as well as in north Parmer County. Wind and hail also occurred on the 8th at Borger with damage amounting to $10,000. On the 10th, hail damaged a heavy proportion of the wheat crop at Hereford. On the 11th, in Swisher, Floyd and Hale Counties, hail devastated the wheat crop and affected 30,000 acres of cotton. On the 11th, also, a tornado and hailstorm occurred in Terlingua with only minor damage since it was sparsely settled ranch land. On the 14th, wind and hail destroyed cotton crops near Big Spring, with crop damage estimated at $26,000 and other property to the extent of $110,000. Tornado clouds were reported by pilots on the 19th near Taft and on the 20th near Beaumont; however, neither funnel cloud touched the ground.

FLOOD OF JUNE 26-28, 1954

The flood of June 26-28, 1954 was the greatest of Rio Grande written history. Excessive rains fell over the lower Pecos River valley and adjoining areas to the east on the night of June 26 and morning of June 27. Supplemental precipitation data are tabulated elsewhere in this bulletin. The main rain source was in the Langtry-Sheffield-Ozona area, where as high as 27.1 inches of rain occurred in 48 hours near Pandale. Flash floods in normally dry arroyos washed out highway and railway bridges and fills. The Sunset Limited on the Southern Pacific was stranded with about 266 passengers at Langtry. Some of the passengers were evacuated by helicopter. About 200 automobiles were also stranded at that point. The highway bridge over the Pecos River was washed out. Some damage occurred in the city limits of Del Rio and Eagle Pass, but the major damage was in Laredo. Practically all deaths and the extreme damage to property was on the Mexican side of the River. Flooding also occurred along the Nueces River. Only minor damage occurred on the Nueces as most of the territory flooded was ranch country.--CBC

This issue contains additional precipitation data for the storm of June 26-28 on Page 145.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

Ⓓ	Data in the column formerly headed "No. of Days .01 or more" have been changed to "No. of Days .10 or more" effective January 1, 1954.
-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

WRPC, KANSAS CITY, MO., -- 8-26-54 -- 1680

CORRECTIONS

January 1953:	Carrizo Springs, Table 2, total precipitation should be 0.00, departure -1.08, greatest day 0.00, days .01 or more 0, days .50 or more 0, and days 1.00 or more 0.
	Carrizo Springs, Table 3, delete dashes on the 15th and 22nd. Total should be 0.00.
	Denton Exp. Station, Table 2, total degree days should be 421.
February 1953:	La Pryor, Table 2, days with max temperatures 90 or above should be 0.
March 1953:	Callan, Table 3, delete all precipitation amounts and add dashes for all days and the total.
	William Harris Res., Table 2, delete total degree days.
April 1953:	Haskell, Table 5, max temperature on the 21st should be 78.
June 1953:	Rio Grande City, Table 2, days with max 90 or above should be 30, max 32 or below 0, min 32 or below 0.
July 1953:	Station Index, delete symbol and note, "Continuation of Fort Worth Meacham Field" record at end of Index.
November 1953:	Rocksprings, Table 2, precipitation departure should be -0.79.
December 1953:	Beeville, Table 6, evaporation on 1st should be .10, 2nd missing, and total 2.95B.
	Hye, Table 3, add dashes for all daily amounts and total.
	Raymondville, Table 2, mean maximum should be 67.8M, mean Minimum 59.2M, and days with max 32 or below 0.
	Raymondville, Table 5, maximum on 19th should be missing and mean 67.8.
January 1954:	Boquillas Ranger Station, Table 2, days with max 90 or above should be 0.
May 1954:	Table 2, degree days should be 0 for the following stations: Boquillas Ranger Station, Brownsville WB AP, Laredo WB AP, Mc Allen, and Port Isabel

Volume LIX No. 7

KANSAS CITY: 1954

TEXAS - JULY 1954

E. A. Farrell, Section Director - Houston

WEATHER SUMMARY

Temperatures ranged from near normal along the Rio Grande Valley to much above normal over interior sections, with 4-6° above in the Panhandle and North Central divisions. All-time high temperature records were set at some localities, and new records for July high temperatures were set at many localities. Precipitation was generally deficient, except that the dissipating storm that moved over the southwestern Louisiana coast on the 29th caused heavy to excessive rains in the eastern portion of the upper coast section.

Showers were well distributed over the month, but scattered as to area. The lowest temperature for the month was 51° at Mount Locke on the 1st, when most stations recorded their monthly minimums. The month was generally hot, but from the 25th to the 27th most stations were unusually hot with temperatures exceeding 110° over a large area in the interior of the State. The highest temperature for the month was 114°, which occurred at Albany, Bridgeport, and Palestine on the 25th, and also at Boquillas Ranger Station (Big Bend Park) on the 27th. As the second Gulf storm of the season moved inland in southwestern Louisiana on the 29th, heavy to excessive rains fell in the eastern portion of the upper coast with a center slightly northwest of Houston of 11.33 inches in 24 hours at Satsuma (Harris County). Heavy damage to residential property in northwest Houston resulted from slow drainage into Bayous in the area on the 30th and 31st. Incidentally, the newly constructed Lake Houston was filled by heavy runoff on the San Jacinto watershed.

Crop prospects continued downward over most of the State as temperatures regularly hit the 100-105° marks and the nearly State-wide drought increased in severity. In South Texas, cotton picking, corn snapping, sorghum combining and peanut threshing moved along in the hot, open weather. Conditions were favorable for active transplanting of early fall-crop vegetables in South Texas and seed bed plantings of early winter vegetables are making good progress. Fall range and pasture feed prospects were improved in southeastern some central and Cross Timbers and most northern High Plains counties by moderate to heavy rains in those favored areas. Stock water was short on many farms in central and northeastern counties.

LOCAL STORMS

On the 1st, a wind storm at Meacham Field, Fort Worth, damaged about 40 airplanes, including two DC-3's. Damage was estimated at $500,000. Also on the 1st, lightning killed a 9-year old boy while he was playing in his back yard in Wilmer (Dallas County). On the 6th, at Weimar (Colorado County), a tornado destroyed a 60-foot barn. Also on the 6th, wind unroofed 4 or 5 houses and moved a church from its foundation at Garfield (Travis County) with damage amounting to $10,000. On the 8th, at Greenville (Hunt County) a tornado and hail storm broke window panes and uprooted trees; sheds were toppled and barns unroofed. On the 9th, at Texarkana (Bowie County) a wind and hail storm damaged plate glass windows, signs and roofs, amounting to $1,200. At Nacogdoches, on the 11th, two youths were injured when their car was tipped over by a windstorm. At Selma (Bexar County) on the 12th, a tornado unroofed two barns and a shed, and scattered beehives, with damage estimated at several thousand dollars. On the 14th, a windstorm destroyed a barn, killing two hogs at Valley View (Cooke County) and lightning fired a home but the blaze was extinguished. A tornado on the 18th at Tatum (Rusk County) demolished a gymnasium, destroyed garages, barns and small buildings with damage amounting to $40,000. On the 26th, a windstorm demolished the screen of an outdoor theater near Brenham (Washington County) with damage amounting to $20,400. On the 31st, lightning fired a church, burning it to the ground near Dime Box (Lee County) with damage of $12,000.--CBC

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

⊙	Data in the column formerly headed "No. of Days .01 or more" have been changed to "No. of Days .10 or more" effective January 1, 1954.
-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
•	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15 cents per copy; monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

TEXAS - AUGUST 1954

E. A. Farrell, Section Director - Houston

WEATHER SUMMARY

Temperatures averaged above normal in all major divisions of the State, and were particularly high in the North-Central division, where they were 3-4° above normal, and the daily maximum temperatures generally averaged in excess of 100°. Above normal precipitation in the South Plains and extreme western portion of the State with near normal rainfall in the contiguous area proved beneficial, but below normal precipitation was experienced over most of the eastern and central portions as drought conditions persisted.

As the month began, heavy showers occurred in the northern third and in west-central Texas on the first three days. From the first of the month to the 20th scattered showers were frequent in the extreme west and northwest, but most heavy rain occurred after the 20th. This was not sufficient in most sections to counterbalance the deficiency of the first two-thirds of the month. The greatest 24-hour precipitation was 4.04 inches at Nogalus Guard Station on the 23rd. The greatest monthly precipitation was 5.74 inches at Cornudas Service Station, in the extreme western division, which seldom receives the greatest amount. Temperatures were generally hot all month, although some relief came between the 9th and 12th generally. The lowest temperature for the month was 51° at Mount Locke on the 6th, 7th, 26th, and 29th. Although most stations recorded their monthly maxima on the 30th and 31st, the highest temperature for the month was 112° at Boquillas Ranger Station, Big Bend National Park, on the 13th.

Cotton, sorghum, corn, peanut and rice harvest moved along over much of the State in generally hot, open weather, with only slight interruption from light, widely scattered showers. Planting of the 1955 wheat crop started in scattered northern Panhandle counties as showers in that area provided moisture for germination. Planting and transplanting of vegetables made normal progress in the Lower Valley. Fall range and pasture grass prospects were improved in most northern High Plains and Trans-Pecos and some southeastern counties by scattered showers.

LOCAL STORMS

On the 10th, a windstorm destroyed a house and barn one mile east of Gonzales with damage estimated at $6,000. Several small buildings were unroofed by wind on the 19th at Carlton, Hamilton County. Wind demolished barns, chicken houses and other small buildings with damage amounting to $5,000 near Austin on the 22nd. Also on the 22nd, wind demolished a three-room house and other buildings in Wuthrich Hill Community, 8 miles northeast of Taylor. On the 23rd, one person was killed by lightning in Austin. On the 29th, wind unroofed a house, barns, and two poultry houses in Waxahachie with damage amounting to $5,000 to buildings and $1,250 to cotton. Also on the 29th, one person was killed by lightning on the Dallas Athletic Club golf course. On the 30th, a tornado which did not touch the ground was observed 20 miles southeast of Junction. Also on the 30th, one person picking cotton was killed by lightning at Cisco, Eastland County. Windstorms with varying amounts of damage were reported on the 30th from Red River County, Forth Worth, Cuero, Gonzales, and Crockett. Also on the 30th, wind did local damage in North Dallas and Park Cities amounting to $75,000 and one person was killed by lightning in Dallas. On the 31st, an unconfirmed tornado blew down a Negro school building and several small residences at Elkhart, Anderson County, causing $8,000 damage. Windstorms were also reported on the 31st at Cuero and El Campo.--CBC

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

©	Data in the column formerly headed "No. of Days .01 or more" have been changed to "No. of Days .10 or more" effective January 1, 1954.
-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 20 cents per copy; monthly and annual, $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

TEXAS

SEPTEMBER 1954

Volume LIX No. 9

KANSAS CITY: 1954

TEXAS - SEPTEMBER 1954

WEATHER SUMMARY

Hot dry weather persisted most of the month with many daytime temperatures above the 100° mark. All monthly temperature averages were above normal except at two stations, with only 35 percent of normal rainfall over the State. The month averaged hotter and drier than any September of record except that of 1931. Fair weather favored harvesting of crops but the intense and continuing drought reduced yields and delayed planting of crops for 1955 season.

Temperature averaged 79.9° or 3.6° above normal. Only two stations, Mount Locke near the western edge of the Panhandle and Clarksville in the extreme northeast, had monthly mean temperatures slightly below normal. At all other stations means were above normal. Departures exceeded four degrees over extensive areas in the central and northern parts of the State. Daily mean temperatures remained above normal except for two short periods. The highest temperatures generally occurred the first few days, on the 9th and 10th, and from the 19th to 21st. The extreme was 110° at Boquillas Ranger Station on the 20th. The coolest days were the 22d and 23d with the lowest temperature, 40°, at Warren on the 23d.

Rainfall averaged 1.01 inches, slightly more than one-third of normal. A few stations in the northeast along the Oklahoma line and a few west of Brownsville along the international boundary received more rain than normal. Otherwise, deficiencies of two inches were general, reaching three inches over scattered areas in the central part and along the Gulf. Port Arthur received only 0.87 inch or 4.06 inches less than the average September rain amount for that station. The rains occurred mostly as light to moderate widely scattered showers during the second and third weeks and as more general showers during the last two days of the month. A number of localities reported over two inches of rain on the 30th with amounts above three inches occurring at a few stations on that date.

The hot weather caused cotton bolls to open prematurely but picking progressed rapidly throughout the month except slower in the irrigated fields. The harvest of corn was substantially complete. Cultivation of commerical vegetables progressed well. Lack of soil moisture, necessary for germination, delayed wheat planting. Some seed was "dusted in" in hope of rains. Volunteer wheat dried out. Sorghums needed rain and the persistent drought decreased the yield of peanuts. Stock raisers found it necessary to supplement the dwindling forage furnished by the deteriorating pastures. The west continued to suffer from the drought the last two days as rains brought some relief to the central, east, and south, but even in these favored areas, more rains were needed to overcome the effects of the protracted heat and lack of rain.

STORMS

Three small tornadoes were observed on the 29th: one in Chico, Wise County, slight damage; one at Dallas Airport, no damage; the third near Sherman, Cooke County, no damage. Also, there were three suspected tornadoes near Whitesboro, Grayson County, on the 29th; several barns were destroyed, roofs damaged, and poultry houses toppled.

L. W. Dye

STATION INDEX

Continued

Station	Index No	County	Drainage†	Latitude	Longitude	Elevation	Observation time		Observer	Refer to tables
							Temp	Precip		
[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

Ⓓ	Data in the column formerly headed "No. of Days .01 or more" have been changed to "No. of Days .10 or more" effective January 1, 1954.
-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 20 cents per copy; monthly and annual, $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

OCTOBER 1954

Volume LIX No. 10

KANSAS CITY: 1954

TEXAS - OCTOBER 1954

WEATHER SUMMARY

The first two weeks were warm; the next ten days or so, about normal with the usual seasonal temperature fluctuations; and the last five or six days, cool. Rainfall ranged from a few ineffective widely scattered showers over parts of the High Plains to rather generous amounts over the eastern fourth of the State and over the extreme south. The October rains improved the 1954 crops. The 1955 crop prospects were unusually promising where the rains during September and October were ample but uncertain over parts of the High Plains where rains were needed.

The first part of October was quite warm with maximum temperatures generally near 90° on the 1st increasing to the upper 90's by the 4th and exceeding 100° at a few stations on that date. A cold front passage near the end of the first week lowered temperatures to near normal but the weather became hot again during the second week. The highest temperature for the month was 104° at Boquillas Ranger Station on the 2d, 3d, and 13th. The second cold front, which passed over the State at the end of the second week, lowered the temperature to below normal for two days, after which near-normal temperatures prevailed for about ten days. A third cold front crossed the State on the 25th to 28th, bringing the coolest weather of the month with minimum temperatures ranging from the 20's in the north to the 40's over much of the south but to only 61° at Brownsville. The lowest for the State was 23° at Miami on the 31st. Killing frost ended the growing season over the Panhandle on the 28th and 29th.

Rainfall exceeded three inches over the eastern fourth of the State, and ten inches in the extreme south and over widely scattered areas in the northeast. The greatest amount was 19.52 inches at Athens. In contrast, a number of stations received no rain during October. Heavy rains occurred over scattered areas of the south and northeast during the first few days with 24-hour falls exceeding six inches at several stations: Athens, 6.04 inches; Brownsville, 6.67 inches; Hidalgo, 6.03 inches; and Mission, 6.56 inches. There was some local flooding in the Brownsville area. A squall line produced a band of local heavy rains on the 22d and 23d over the Coastal Plains from Falfurrias and Corpus Christi northward. Heavy rains also fell over a wide area of the northeast from the 22d to 29th causing some flooding along the Sabine River. Local thundershowers occurred on a number of other days with amounts ranging from light to heavy, except for the 15th to 21st which were almost rainless.

The crop situation was very closely related to the rainfall and moisture condition. For instance, the surface moisture and subsoil moisture was deficient over the High Plains and the Low Rolling Plains. October showers over parts of the High Plains started the newly planted wheat but more rains were needed. Over other parts of the High Plains and over the Low Rolling Plains, some intended acreage was not planted and much of the grain which was planted was struggling to survive. In sharp contrast, small grain prospects were unusually promising over the northern Blackland and eastern counties where September rains had started the crop and October rains were expected to carry it well into the winter. Late season rains increased the yields of other Texas crops, notably corn, cotton, grain sorghums, peanuts, sweet potatoes, and citrus fruits.

Lucius W. Dye

LOCAL STORMS

On the 1st a small tornado caused damage of $1100 near Valentine, (Jeff Davis County). On the 11th, a tornado did severe damage to the roof of the only home in its path with damage estimated at $1600 at Salesville (Palo Pinto County). On the 13th, a tornado cloud was observed near Galveston by the observer at the Airport, but the funnel cloud did not touch the surface. On the 14th, a funnel cloud was observed near Freeport which did not touch the ground. Five storms were reported on the 22d: The first was a wind and hail storm which destroyed a field of turnips as well as damaged a barn roof with only minor damage near Jacksonville (Cherokee County). The second was a tornado accompanied by hail near Madisonville with $6000 damage, 80% due to the tornado and 20% due to hail. The third was a tornado accompanied by hail at Bloomington (Victoria County). Damage amounting to $10,000 was done to 10 homes and 15 other buildings. The fourth was a tornado accompanied by hail at Portland (San Patricio County), where 25 homes were destroyed and 250 damaged. Hail was the size of golfballs with some reported as large as baseballs. Damage amounted to $400,000. The fifth was a wind and hail storm at Corpus Christi with damage amounting to $10,000. Most of the damage was due to the wind as hail was only light.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Station names appearing in tables, but for which data are not listed, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 0630 CST. "WTR EQUIV" in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more. Water equivalent samples are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

Φ	Data in the column formerly headed "No. of Days .01 or more" have been changed to "No. of Days .10 or more" effective January 1, 1954.
-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in Station Index means after rain.
B	Adjusted to a full month.
C	Data for recorder stations, denoted by "C", are processed for special purposes and published later in Hourly Precipitation Data.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.
R	Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data).
T	Trace, an amount too small to measure.
V	Includes total for previous month.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 20 cents per copy; monthly and annual, $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

TEXAS - NOVEMBER 1954

WEATHER SUMMARY

Temperatures averaged near normal and rainfall slightly less than two-thirds of normal. Crop Growth and agricultural activities throughout the month progressed in close relation to rain and soil moisture conditions. Wheat prospects deteriorated over much of the high plains where rains were urgently needed. Commercial vegetables progressed satisfactorily under adequate rainfall conditions. There was heavy marketing of cattle and calves during the first half of the month; marketing tapered off at mid month and was about over by the end of November.

The first week was cool. Mean temperatures over some areas were about 15° below normal on one or more days from the 2d to the 4th. The coldest temperature during the month was 18° at Follett on the 2d. Frost occurred on the morning of the 6th as far southeast as the Eagle Pass-Cotulla-Alice-Lufkin line. After the first week, temperatures fluctuated from slightly below to several degrees above normal. The average temperature for the State was 56.1° or 0.4° above normal. Monthly mean temperatures for individual stations ranged from 27.4° at Muleshoe to 69.8° at Port Isabel. The highest temperature during the month was 90° at Mansfield Dam on the 17th.

Practically all the rains occurred during three brief periods. Light to moderate showers fell over the eastern third of the State on the 3d and 4th. Scattered showers and local thunderstorms on the 9th and 10th and on the 14th and 15th brought moderate to heavy amounts to the north central and northeast parts. No significant rains occurred after the 15th. There was a rather large range in the monthly amounts. Numerous stations, mostly in the western part of the State and in the Panhandle, received no rain during the month. Richards 1 W received more than any other station, 5.32 inches. Some stations in the north central, northeast, and south central received above normal amounts but most stations received less than normal rainfall, with deficiencies exceeding two inches over an area extending from Austin to Galveston and Port Arthur.

Irrigated wheat in the High Plains made good growth throughout the month. Some dryland wheat in that area was holding up but prospects over much of the country were deteriorating in the powder dry soil. Some fields were being grazed but were furnishing very little feed. In the Low Plains, some acreage remained to be planted and the wheat which was coming up needed rain to get roots established. Mechanical harvest moved into the cotton fields of the irrigated areas of the northwest in the final week of the month. Sorghum combining in that area was nearly completed. Commerical vegetables progressed satisfactorily in the Lower Valley. The end of the month found growers planting additional crops of cabbage, carrots, and lettuce, harvesting beans and other tender vegetables, and preparing land for early spring crops. Onion planting occupied the growers in the Coastal Bend. A few cars of tomatoes moved from the Laredo district, but active loading had not yet started. Marketing of citrus, particularly for gift packages, was active with the demand for export shipments heavier than usual. Small grain pastures in northern Blacklands and in eastern and southern counties were still supplying considerable green feed but lack of moisture in the south and the cool temperatures in the north slowed growth. Stalk fields in the High Plains continued to supply considerable feed but fields in other areas were about eaten out. The fall movement of stocker and feeder calves and yearlings was about over with the ranchers shaping up to carry their remaining stock through the winter.

Storms and Floods

There was insufficient rain in November to produce flooding. Rains that occurred in October, and produced a crest at Naples on October 31, caused slight overflow at McCartney Bridge from November 12 to 14th. Little or no damage resulted.

One person was killed by lightning during football practice at Northeast Rural High School near San Antonio on November 9. Three others were stunned by the bolt.

Lucius W. Dye
